**LEARNING DIARY, <CHOSEN MODULE NAME> MODULE**

## **LEARNING DIARY**

22.5.2024

I read the general course information to understand what the course is about and how to get started. I already have VS code and Android studio and I am familiar with how to use them so I will use them for this course.

8.7.2024

I watched the first video and successfully did the calculator app in Android studio. This task was easy and fast to do since I am familiar with Android studio. I also started the second video and task. I was having trouble with the google button not working. After researching I managed to solve the issue. This was first time I had to integrate external links in an android app.

9.7.2024

I finished the second video's task and also did the third one. That one was also easy and worked right away. I was able to use my previous knowledge in this task. I did get some more in-depth knowledge from the video and understand the things better.

12.7.2024

For my project task I decided to develop a notes app. In the app you can add notes and they are visible in a list. I also want to add deleting and editing options, but it took long time to just get the note adding functionality to work. Some googling and the videos helped me with the problems I faced. Also checking my earlier codes from other course helped with some problems.

15.7.2024

I did the editing and deleting functions for the app. I had some problems with it but mostly it worked well. I faced an issue with Android Studio where the device didn't connect, but after researching and creating a new device, the problem was solved. This experience taught me about device management and troubleshooting in Android Studio. I added the project and some courseworks in the repository.

18.7.2024

I did the video of my project running and added that in the repository. I did a ReadME file of how to run my project.
